

# Field of Application Report

KFS Report PAR/10899/01 Revision I

Fire Resistance Standard: BS476: Part 22: 1987

Prepared for:

PKF Global Ltd

Assessed Product/System:

Three-Layer Particleboard Leaves, With or Without Feature Grooves, Installed in Timber Frames

Assessed Performance:

30 Minutes Fire Resistance

Issue Date

August 2023

Expiry Date

February 2027

## Kiwa Fire Safety Compliance

Kiwa Fire Safety Compliance is part of the **Kiwa UK Group**. The company is a specialist engineering consultancy delivering independent, honest and practical fire safety solutions to professionals across the built environment. The sought after fire safety advice protects life, preserves property and safeguards business continuity.

Formerly International Fire Consultants, the company was established in 1985 to provide high quality and impartial technical expertise concerning fire safety. Since then the team of highly qualified Fire Engineers and Fire Safety Professionals have continued to deliver robust, innovative and cost-effective fire safety solutions, including Assessments, Designs and Inspections.

Kiwa Fire Safety Compliance lend their insight and practical expertise for: Fire Safety Engineering, Fire Risk Management, Product Evaluation, Fire Life Safety Systems, Expert Witness Testimony and Fire Protection Training, to developments of all sizes and complexities; from residential, education and healthcare structures to sporting venues, airports and iconic heritage buildings, such as historical royal palaces and stately homes.

Recognised internationally as the go-to professionals in all aspects of fire safety, Kiwa Fire Safety Compliance is one of the world's leading fire engineering and solution providers, trusted by many of the most prestigious construction firms, architects and estate owners.

## 1. Introduction

This report has been prepared by Kiwa Fire Safety Compliance (KFS), on the instruction of PKF Global Ltd, to define the Field of Application for the three-layer particleboard leaves, with or without feature grooves, installed in timber frames, that are required to provide 30 minutes fire resistance performance, when adjudged against BS476: Part 22: 1987.

This assessment has been produced using the principles outlined in the [Passive Fire Protection Forum \(PFPF\): 'Guide to Undertaking Technical Assessments of the Fire Performance of Construction Products Based on Fire Test Evidence, 2021, Industry Standard Procedure'](#).

When establishing the variations in the construction that can achieve the required fire resistance performance, KFS complies with the principles found in the following documents:

- [BS ISO/TR 12470-2: 2017 'Fire resistance tests - Guidance on the application and extension of results from tests conducted on fire containment assemblies and products. Part 2: Non-load bearing elements'](#).
- [EN 15725: 2023 'Extended application reports on the fire performance of construction products and building elements'](#).

It is proposed that variations to the tested specifications, as described in the following sections, may be accommodated into door assemblies, without reducing their potential to achieve a 30 minute integrity rating, if tested in accordance with the method and criteria of BS476: Part 22: 1987.

The omission of information on any components or manufacturing methods does not imply a lack of approval of those details, but these would need to be the subject of a separate analysis. Only variations specifically mentioned are supported by this assessment document, all other aspects must otherwise be as proven in tests summarised herein.

It is more onerous to test timber door assemblies, hinged or pivoted, with the specimen installed with the leaf opening in towards the furnace. Testing in this orientation is therefore incorporated into Field of Application Reports to cover doors opening in the opposite direction. The principle is only applicable when the door construction, and any features within the door leaf, such as glazing, are symmetrical.

Unless stated otherwise, herein, this Field of Application considers the scope of approval for door assemblies that may be installed in either orientation, that being with either face exposed to fire conditions.

## 2. Test Evidence

The test evidence used to support this Field of Application Report is summarised in Appendix C of this report.

Some of the test evidence referenced in this Engineering Assessment Report is more than 5 years old. In accordance with industry practice, KFS have reviewed this test evidence, and have concluded that the evidence is still valid, and suitable to form the basis of this approval.

### 3. Scope of Approval

#### 3.1 Door Assembly Configurations

| GENERAL REQUIREMENTS/NOTES   |
|--|
| <ul style="list-style-type: none"> <li>The table below provides an overview of the approved door assembly configurations when using a typical FD30 three-layer particleboard leaf, with or without feature grooves, installed in timber frames.</li> <li>Figures A01 to A04 in Appendix A outline the full scope of door assembly configurations approved by this report.</li> <li>Optional transomed overpanels are permitted across all of the door assembly configurations approved for use with timber door frames.</li> </ul> |

| CONFIGURATION   |        |
|---|--------|
| DESCRIPTION   | CODE   |
| Latched, Single Acting, Single Leaf (With or Without Transomed Overpanel)   | LSASD  |
| Unlatched, Single Acting, Single Leaf (With or Without Transomed Overpanel) | ULSASD |
| Latched, Single Acting, Double Leaf (With or Without Transomed Overpanel)   | LSADD  |
| Unlatched, Single Acting, Double Leaf (With or Without Transomed Overpanel) | ULSADD |

#### 3.2 Maximum Assessable Door Leaf Sizes

This Field of Application Report is based on fire resistance tests conducted on the FD30 three-layer particleboard leaf, with or without feature grooves, which have been analysed using the empirically derived, non-construction specific methodologies which form the basis of KFS’s analysis. These methodologies allow the data obtained from the fire test evidence to be evaluated to determine permissible door leaf sizes, without any additional enhancements.

The calculated envelopes of assessed leaf dimensions for each door assembly configuration covered by this Field of Application report are given in Appendix A.

Double door assemblies may each be of the same width, up to the maximum width indicated in Appendix A. For unequal pairs there is no limit on the ratio of leaf widths, (although the large leaf must still be within the limitations in Appendix A). The width of the small leaf shall not be less than 250mm, since this will affect its vertical stability relative to that of the larger leaf.

## 4. Door constructional details

Constructional specifications for the FD30 three-layer particleboard leaf, with or without feature grooves, can be found in the tables below.

Timber must have a minimum measured density at 15% moisture content. The timber must be straight grained and of appropriate quality in accordance with BS EN 942: 2007. The moisture content shall be  $11 \pm 2\%$  for UK market, (or to suit internal joinery moisture content specification of export countries).

### 4.1 Leaf Construction

#### 4.1.1 Leaf Thickness

| MINIMUM LEAF THICKNESS |
|------------------------|
| 44mm                   |

| ADDITIONAL REQUIREMENTS/NOTES  |
|--|
| <ul style="list-style-type: none"> <li>The dimension above excludes the thickness of the decorative leaf facings detailed in Section 4.4</li> <li>There are two alternative options for the leaf construction, both of which are covered by the same leaf size envelopes in Appendix A</li> <li>The maximum leaf sizes referenced in Appendix A assume that each layer of core, (and facings in Option 1), shall be formed from one piece, and joints shall not be used to achieve an increase in leaf height /width. If the core/facing materials are not available at a size to suit the maximum leaf sizes defined in Appendix A, then a reduced leaf size will be determined by the available core/facing materials</li> </ul> |

#### 4.1.2 Option 1

| COMPONENT |                        | MATERIAL                          | DIMENSIONS  | MINIMUM DENSITY      |
|-----------|------------------------|-----------------------------------|-------------|----------------------|
| Core      | Inner layer            | Particleboard                     | 13mm thick  | 550kg/m <sup>3</sup> |
|           | Outer layers           |                                   | 13mm thick  |                      |
| Facings   |                        | MDF                               | 2.5mm thick | 700kg/m <sup>3</sup> |
| Adhesives | Between layers of core | PVA adhesive                      | -           | -                    |
|           | Facings                | Urea formaldehyde or PVA adhesive |             |                      |

### 4.1.3 Option 2A

| COMPONENT |                        | MATERIAL      | DIMENSIONS   | MINIMUM DENSITY      |
|-----------|------------------------|---------------|--------------|----------------------|
| Core      | Inner layer            | Particleboard | 12mm thick   | 550kg/m <sup>3</sup> |
|           | Outer layers           |               | 15.5mm thick |                      |
| Adhesives | Between layers of core | PVA adhesive  | -            | -                    |

### 4.1.4 Option 2B

| COMPONENT |                        | MATERIAL      | DIMENSIONS   | MINIMUM DENSITY      |
|-----------|------------------------|---------------|--------------|----------------------|
| Core      | Inner layer            | Particleboard | 15mm thick   | 550kg/m <sup>3</sup> |
|           | Outer layers           |               | 14.5mm thick |                      |
| Adhesives | Between layers of core | PVA adhesive  | -            | -                    |

## 4.2 Door Lippings

### 4.2.1 General

| LOCATION                                 | MATERIAL                          | MINIMUM DENSITY      | MINIMUM THICKNESS      | PROFILE                | LIPPING ADHESIVE                               |
|--|-----------------------------------|----------------------|------------------------|------------------------|--|
| Vertical leaf edges                      | Solid and finger-jointed hardwood | 640kg/m <sup>3</sup> | Refer to Section 4.2.2 | Refer to Section 4.2.2 | Urea formaldehyde, PVA or vinyl urethane-based |
| Door leaf horizontal and overpanel edges | Solid or finger-jointed hardwood  | 640kg/m <sup>3</sup> | Refer to Section 4.2.2 | Refer to Section 4.2.2 | Urea formaldehyde, PVA or vinyl urethane-based |

#### ADDITIONAL REQUIREMENTS/NOTES

- Lippings must be installed on all four leaf edges
- Installed lippings may be reduced in thickness for site installation purposes, provided the minimum lipping thickness detailed in Section 4.2.2 is maintained
- There must be no gaps present between the stiles/rails and the lippings
- Lippings may be concealed under the MDF facing (in option 1 design) or by the decorative facings (both option 1 and 2 designs), or be exposed (both option 1 and option 2 designs)

## 4.2.2 Lipping Thicknesses and Edge Profiles

| VERTICAL LEAF EDGES   |   | HORIZONTAL LEAF AND OVERPANEL EDGES   |
|---|---|---|
| JUST SOLID HARDWOOD   | SOLID + FINGER JOINTED HARDWOOD   | SOLID OR FINGER JOINTED HARDWOOD  |
|    | or<br> |  |
| PERMITTED LIPPING LOCATION  |   |   |
| All door leaf vertical edges.<br>Just solid hardwood<br>or<br>Finger-jointed hardwood bonded to the door core and solid hardwood covering the finger-jointed hardwood |   | All door leaf horizontal and overpanel edges  |
| LIPPING THICKNESS   |   |   |
| 4.5-20mm thick  | 9-20mm (total)  | 8-15mm  |
| ADDITIONAL REQUIREMENTS/NOTES   |   |   |
| Each lipping element to be a minimum 4.5mm thick  |   |   |

## 4.3 Decorative Leaf Facings

| COMPONENT/AREA  | MATERIAL                     | MAXIMUM THICKNESS |
|-----------------|------------------------------|-------------------|
| Leaf faces only | Timber Veneer                | 2mm               |
|                 | High Pressure Laminate       | 2mm               |
|                 | PVC Laminates (e.g. Acrovyn) | 2mm               |
|                 | Paper                        | 1mm               |
|                 | Decorative Foil              | 0.5mm             |

| ADDITIONAL REQUIREMENTS/NOTES  |
|--|
| <ul style="list-style-type: none"> <li>Decorative facing materials must not be applied to the leaf edges</li> <li>With the exception of push/kick plates (See Appendix B.5), metallic facings are not permitted</li> </ul> |

## 4.4 Decorative Leaf Finishes

| COMPONENT/AREA            | MATERIAL | MAXIMUM THICKNESS                                    |
|---------------------------|----------|--|
| Leaf faces and leaf edges | Paint    | 0.5mm, or a maximum of 5 coats whichever is greater. |
|                           | Lacquer  |  |
|                           | Varnish  |  |

## 4.5 Feature Grooves

The proposed door leaf designs can incorporate feature grooves machined into both leaf faces

### 4.5.1 Option A - With Hardwood Inserts (Can be Used With Door Option 1 or 2)

| Typical Feature Groove Profiles   |                    |   |                       |
|---|--------------------|---|-----------------------|
|  |                    |   |                       |
| Maximum Size  | Harwood Insert     | 24mm wide x 10mm thick  | 12mm wide x 8mm thick |
|   | Feature groove     | 10mm wide x 7mm deep  | 8mm wide x 4mm deep   |
| Groove Quantity/<br>Orientation<br>/Margins                                       | Vertical Grooves   | Maximum 4no. grooves which may extend to the top and bottom leaf edges<br><b>Or</b><br>Maximum 6no. grooves which must <b>not</b> extend to the top and bottom leaf edges but stop 100mm from the horizontal edges<br>In both circumstances, the vertical grooves must be a minimum 90mm in from the vertical leaf edges and minimum 50mm apart   |                       |
|   | Horizontal Grooves | Maximum 6no. which must <b>not</b> extend to the vertical leaf edges, but stop 90mm in from the vertical leaf edges – minimum 90mm in from the horizontal leaf edges and minimum 275mm apart  |                       |
| Approved Leaf Size and Configurations   |                    | Approved for inclusion on unlatched and latched, single and latched, double leaf configurations on all leaf sizes covered within this Field of Application Report   |                       |
| Additional Notes  |                    | <ul style="list-style-type: none"> <li>• Horizontal and vertical grooves may intersect each other</li> <li>• Hardwood inserts adhered in place using PVAc adhesive</li> <li>• Hardwood for inserts can be solid or finger-jointed with a minimum density of 750kg/m<sup>3</sup></li> <li>• Grooves for the hardwood inserts are machined directly into the leaf face, either before or after the decorative face veneer is applied</li> </ul> |                       |
| Test Evidence   |                    | CFR 2009211 + CFR1106291  |                       |

#### 4.5.2 Option B – With Hardwood Inserts (Can be used with Door Option 1 or 2)

| Typical Feature Groove Profiles  |                    |   |
|--|--------------------|---|
|  |                    |   |
| Maximum Size   | Harwood Insert     | 23mm wide x 7.5mm thick   |
|  | Feature groove     | 10mm wide x 2.5mm deep  |
| Groove Quantity/<br>Orientation<br>/Margins  | Vertical Grooves   | Maximum 6no. grooves. The grooves nearest the vertical leaf edges may extend to the top and bottom leaf edges, the remaining grooves to stop 90mm short of the leaf head – minimum 90mm in from the vertical leaf edges and minimum 100mm apart   |
|  | Horizontal Grooves | Maximum 6no. which must <b>not</b> extend to the vertical leaf edges, but stop 90mm in from the vertical leaf edges – minimum 90mm in from the horizontal leaf edges and minimum 350mm apart  |
| Approved Leaf Size and Configurations  |                    | Approved for inclusion on unlatched and latched, single and latched, double leaf configurations on all leaf sizes covered within this Field of Application Report   |
| Additional Notes   |                    | <ul style="list-style-type: none"> <li>• Horizontal and vertical grooves may intersect each other</li> <li>• Hardwood inserts adhered in place using PVAc adhesive</li> <li>• Hardwood for inserts can be solid or finger-jointed with a minimum density of 750kg/m<sup>3</sup></li> <li>• Grooves for the hardwood inserts are machined directly into the leaf face, either before or after the decorative face veneer is applied</li> </ul> |
| Test Evidence  |                    | WF 350734 + CFR 2009211   |

### 4.5.3 Without Hardwood Inserts (Option 1 Door Design Only)

| Typical Feature Groove Profile              |                    |    |                               |
|---|--------------------|--|-------------------------------|
| Maximum Size                                | Harwood Insert     | Not applicable - grooves are machined directly into the veneered MDF leaf facing   |                               |
|   | Feature groove     | Rectangular  | Maximum 6mm wide x 1.5mm deep |
| V-shaped                                    |                    | Maximum 6.5mm wide x 1.8mm deep  |                               |
| Groove Quantity/<br>Orientation<br>/Margins | Vertical Grooves   | Maximum 4no. grooves which may extend to the top and bottom leaf edges<br><u>Or</u><br>Maximum 6no. grooves which must <b>not</b> extend to the top and bottom leaf edges but stop 120mm from the horizontal edges<br>In both circumstances, the vertical grooves must be a minimum 120mm in from the vertical leaf edges and minimum 70mm apart |                               |
|   | Horizontal Grooves | Maximum 6no. which must <b>not</b> extend to the vertical leaf edges, but stop 120mm from the vertical leaf edges  |                               |
| Approved Leaf Size and Configurations       |                    | Approved for inclusion on unlatched and latched, single leaf configurations and latched, double leaf configurations on all leaf sizes covered within this Field of Application Report  |                               |
| Additional Notes                            |                    | <ul style="list-style-type: none"> <li>• Horizontal and vertical grooves may intersect each other</li> <li>• Alternatively, a decorative plastic trim may be inserted into a maximum 2mm deep x 2mm wide groove in the leaf face which may also incorporate a decorative metal cover to the face of the trim</li> </ul>                          |                               |
| Test Evidence                               |                    | CFR 1503101 and CFR 2106041 with over-run  |                               |

#### 4.5.4 Combination with and without Hardwood Inserts (Option 1 Door Design Only)

| Typical Feature Groove Profile   |                               |  |
|--|-------------------------------|--|
|  |                               |  |
| Maximum Size   | Harwood Insert With Groove    | 15mm wide x 10mm thick hardwood insert recessed into the leaf core - maximum 10mm wide x 7mm deep groove   |
|  | Feature Groove With No Insert | Maximum 6mm wide x 1.5mm deep  |
| Groove Quantity/ Orientation /Margins  | Harwood Insert With Groove    | Maximum 5no. horizontal grooves which may extend to the vertical leaf edges – minimum 180mm from the horizontal leaf edges and minimum 380mm apart   |
|  | Feature Groove With No Insert | Maximum 4no. horizontal which may extend to the vertical leaf edges – minimum 380mm from the horizontal leaf edges<br>Maximum 2no. vertical which may extend to the horizontal leaf edges – minimum 220mm from the vertical leaf edges   |
| Approved Leaf Size and Configurations  |                               | Approved for inclusion on unlatched and latched, single leaf configurations and latched, double leaf configurations on all leaf sizes covered within this Field of Application Report  |
| Additional Notes   |                               | <ul style="list-style-type: none"> <li>• Horizontal and vertical grooves may intersect each other</li> <li>• Hardwood inserts adhered in place using urea formaldehyde adhesive</li> <li>• Hardwood for inserts can be solid or finger-jointed with a minimum density of 750kg/m<sup>3</sup></li> <li>• Grooves for the hardwood inserts are machined directly into the leaf core prior to being faced with MDF</li> </ul> |
| Test Evidence  |                               | CFR 2106041 with over-run  |

## 4.5.5 Diagonal Grooves

### DIAGONAL GROOVES

- This leaf design may be used as either a single or double, latched door, but the grooves must not clash with hardware at the leaf edges
- This option may be used either with or without hardwood inserts to the specifications outlined in Sections 4.5.1 - 4.5.3

## 4.6 Transomed Overpanels

### 4.6.1 Overpanel Size, Configuration and Specification

| GENERAL REQUIREMENTS/NOTES   |  |
|--|--|
| Overpanels must be of the same construction as the door leaf (refer to Section 4.1) and be lipped on all four edges with hardwood (refer to Section 4.2.2) |  |
| MAXIMUM OVERPANEL SIZE   |  |
| SINGLE DOOR ASSEMBLIES   | DOUBLE DOOR ASSEMBLIES   |
| 1500mm high  | 1000mm high  |
| FRAME MATERIAL OPTIONS   | APPROVED LEAF CONFIGURATIONS   |
| Softwood or hardwood<br>(Minimum density 468kg/m <sup>3</sup> )  | Single or double leaf  |
| MINIMUM TRANSOM SIZE   | TRANSOM JOINT  |
| 70mm wide x 32mm thick   | Mortice and tenon or trench joint  |
|    |  |

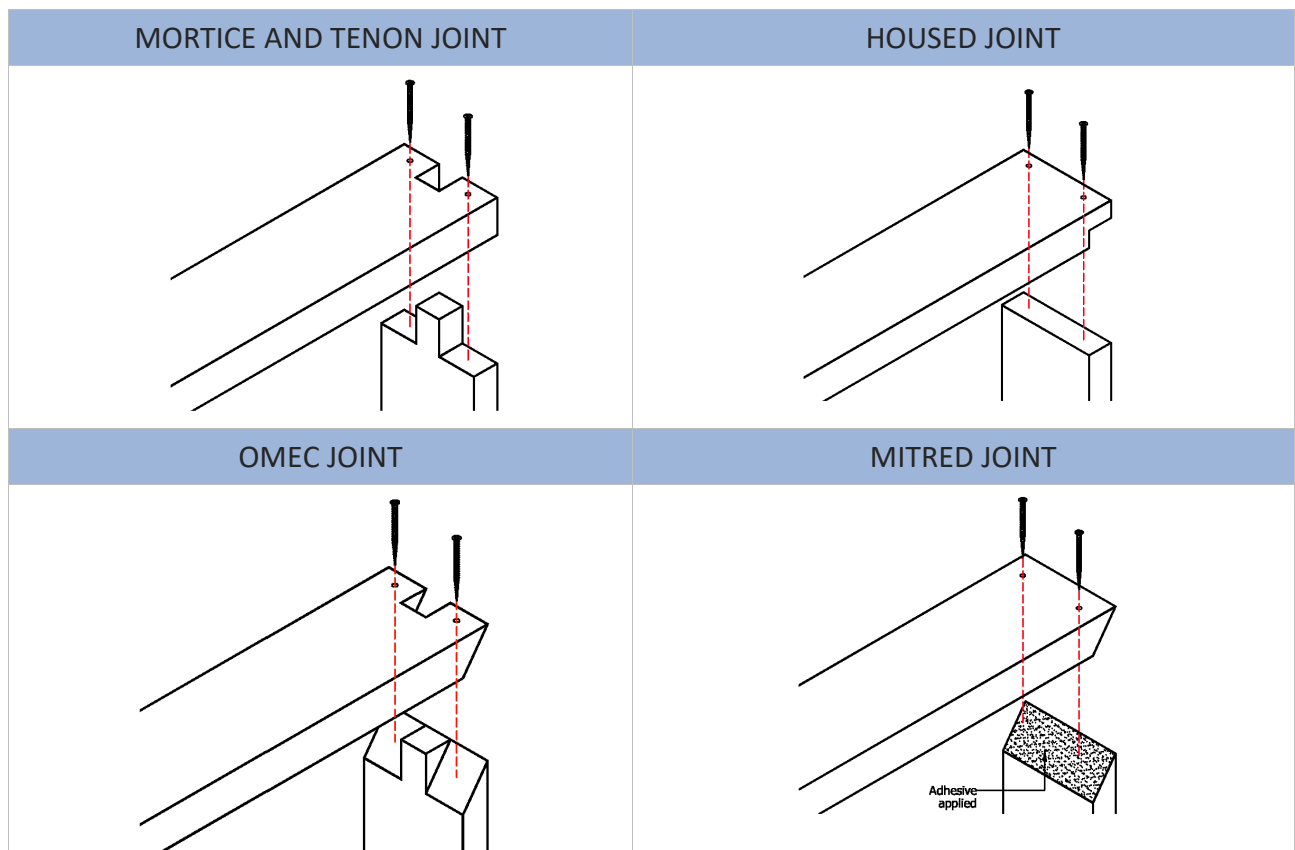

### 4.6.2 Overpanel Fixing

| FIXING REQUIREMENTS   |                             |  |
|---|-----------------------------|--|
|  | Minimum Screw Size          | 5mm x 70mm   |
|   | Minimum Quantity of Fixings | 2no. screws per overpanel edge   |
|   | Fixing Positions            | Maximum 100mm from each corner and on maximum 400mm centres thereafter |
|   | Fixing Penetration          | Minimum 40mm of screw penetration into overpanel edge                  |

## 4.7 Door Frames

### 4.7.1 Head Joints

- The frame head must be secured to each jamb using 2no. minimum 5mm x 80mm screws
- In addition to screw fixings, mitred joints must also be glued with cross-linking adhesive e.g. urea formaldehyde, polyurethane or resorcinol formaldehyde

## 4.7.2 Specifications and Profiles

| FRAME PROFILE F30/1   |                     |                      |   |
|---|---------------------|----------------------|---|
|  | Frame Material      |                      | Softwood, Hardwood or MDF   |
|   | Minimum Density     | Softwood or Hardwood | 468kg/m <sup>3</sup>  |
|   |                     | MDF                  | 700kg/m <sup>3</sup>  |
|   | Minimum Thickness   |                      | 30mm  |
|   | Minimum Frame Depth |                      | 70mm  |
| Minimum Stop Thickness  |                     | 12mm                 |   |
| Additional Requirements/Notes   |                     |                      | <ul style="list-style-type: none"> <li>The minimum frame thickness detailed above excludes the door stop</li> <li>The doorstop is to comprise the same material as the door frame and must be fixed in place using 40mm long steel pins at maximum 300mm centres</li> <li>Architraves are optional – refer to Section 4.11 for gap sealing/firestopping requirements</li> </ul> |

| FRAME PROFILE F30/2   |                     |                       |   |
|---|---------------------|-----------------------|---|
|  | Frame Material      |                       | Softwood, Hardwood or MDF   |
|   | Minimum Density     | Softwood and Hardwood | 468kg/m <sup>3</sup>  |
|   |                     | MDF                   | 700kg/m <sup>3</sup>  |
|   | Minimum Thickness   |                       | 30mm  |
|   | Minimum Frame Depth |                       | 70mm  |
| Minimum Stop Thickness  |                     | 12mm                  |   |
| Additional Requirements/Notes   |                     |                       | <ul style="list-style-type: none"> <li>The minimum frame thickness detailed above excludes the integral door stop.</li> <li>Architraves are optional – refer to Section 4.11 for gap sealing/firestopping requirements</li> </ul> |

| FRAME PROFILE F30/3  |                        |                      |
|--|------------------------|----------------------|
|  | Frame Material         | Softwood or Hardwood |
|  | Minimum Density        | 450kg/m <sup>3</sup> |
|  | Minimum Thickness      | 30mm                 |
|  | Minimum Frame Depth    | 70mm                 |
|  | Minimum Stop Thickness | 25mm                 |
| Additional Requirements/Notes  |                        |                      |
| <ul style="list-style-type: none"> <li>• The minimum frame thickness detailed above excludes the door stop</li> <li>• The doorstop is to comprise the same material as the door frame and must be fixed in place using 40mm long steel pins at maximum 300mm centres</li> <li>• Architraves are optional– refer to Section 4.11 for gap sealing/firestopping requirements</li> </ul> |                        |                      |

### 4.7.3 Split Frames

| GENERAL REQUIREMENTS/NOTES  |
|---|
| The overall frame depth may be increased by utilising split frames, but the joint between the two frame sections must not intrude into the minimum frame depth as stipulated in Section 4.7.2 |

### 4.7.4 Decorative Finishes

| DECORATIVE FINISHES |   |
|---------------------|---|
| MATERIAL            | MAXIMUM THICKNESS                                       |
| Paint               | 0.5mm, or a maximum of 5no. coats, whichever is greater |
| Varnish             |   |
| Lacquer             |   |

## 4.8 Glazed Apertures

### 4.8.1 General

| GENERAL REQUIREMENTS/NOTES   |  |
|--|--|
| <ul style="list-style-type: none"> <li>The table in Section 4.8.3 outlines the permitted combinations of glass type, glazing system and bead profile</li> <li>The maximum permitted glazed aperture dimensions are detailed within this table</li> <li>Corresponding aperture widths/heights will need to be adjusted until the proposed aperture area falls within the maximum aperture area detailed within this table</li> <li>The maximum aperture width and maximum aperture height must not be combined, as the resulting figure will always exceed the maximum permitted aperture area</li> <li>Drawings for the approved glazing bead profiles along with the required bead fixing methods can be found in Section 4.8.4</li> <li>All glass is to be installed in accordance with the manufacturer's instructions for expansion allowance, setting blocks, silicone pointing etc</li> <li>Glazed apertures greater than 0.57m<sup>2</sup> must include a 7mm hardwood (minimum density 600kg/m<sup>3</sup>) liner adhered to the inside edge of the aperture, either between the 2.5mm MDF facings, set 2.5mm back from the leaf faces or flush with the leaf faces, adhered in position using either PU or UF adhesive</li> </ul> |  |

### 4.8.2 Aperture Margins

| GENERAL REQUIREMENTS/NOTES          |                     |       |
|-------------------------------------|---------------------|-------|
| Minimum distance from leaf edges    | Head                | 155mm |
|                                     | Vertical leaf edges | 175mm |
|                                     | Bottom edge         | 300mm |
| Minimum distance between apertures* | 100mm               |       |

\*Multiple apertures are permitted providing the total glazed area does not exceed that stated in Section 4.8.3.

### 4.8.3 Glazed Apertures – Approved glass types, glazing systems and bead profiles

| GLASS SPECIFICATION |                      |                   |                    |                     |                      | DIMENSIONS                           |   |   |   | BEAD TYPES |       |                   |                    | GLAZING SYSTEMS                |  |   |   |
|---------------------|----------------------|-------------------|--------------------|---------------------|----------------------|--------------------------------------|---|---|---|------------|-------|-------------------|--------------------|--------------------------------|--|---|---|

| <u>Or</u>  | <b>ADDITIONAL REQUIREMENTS/NOTES</b>   |
|  <p>             Glass types G3, G4 &amp; G5<br/>             Double sided tape<br/>             Hardwood ladder glazing bead         </p>  | None   |

## 4.9 Hardware

Hardware items which are approved for use with the FD30 three-layer particleboard leaf, with or without feature grooves, are detailed in Appendix B of this report.

All hardware items must be installed in accordance with the manufacturer's instructions, except where specific installation requirements or limitations have been detailed by KFS.

## 4.10 Installation and Supporting Construction

### SUPPORTING CONSTRUCTION

The supporting construction may be timber or steel stud plasterboard partition, blockwork, brickwork or concrete walls, but shall be of a type that has been tested or assessed to provide in excess of 30 minutes fire resistance, at the required size, when incorporating door openings. If fitted into timber or steel stud partitions, the method of forming the door assembly aperture must be as tested by the partition and/or door assembly manufacturer.

*Note Any reference to steel stud partitions is in the context of permanent elements, such as those designed and proven by the plasterboard manufacturers – this report does not approve use of the proposed door assemblies in proprietary 'demountable' partitions, which must be subject to a full and independent appraisal of the particular system and door assemblies therein.*

### DOOR FRAME FIXING REQUIREMENTS

Timber door frames must be fixed back to the supporting construction with steel fixings at centres not exceeding 600mm on the vertical edges (minimum 200mm from the top and bottom), and a minimum of one fitted centrally across the width of the frame head of double doors. Screws shall be of sufficient length to remain secure into the supporting construction during exposure to fire, and shall be positioned such that they are not exploited by charring of the frame. Therefore, screws must be located a minimum of 20mm from the frame edge, unless a twin line of screws is used.

### DOOR FRAME PACKERS

Packers shall be used at all fixing positions, although if combustible packers are employed, they must be cut short and be capped with a layer of approved mastic and maintain compliance with one of the approved back of frame sealing methods given in the following sections.

### PROJECTING DOOR FRAMES/DOOR LEAVES

The approval in this report does not apply where the wall/partition includes decorative 'cladding' on the face of the fire-resisting construction, (e.g. timber panelling on battens, or plasterboard on dabs), such that any part of the frame is aligned within the plane of this decorative cladding.

### ARCHITRAVES

Where the face of the frame is flush with the face of the wall, loose architraves are optional, and have no fire performance requirements, and so can be freely specified, subject to suitable gap sealing fire stopping as detailed in Section 4.11.2.

| DOOR EDGE GAPS |                      |                     |                       |                               |
|----------------|----------------------|---------------------|-----------------------|-------------------------------|
|                | Between Leaf & Frame | Leaf Meeting Stiles | Bottom of Door (Fire) | Bottom of Door (Fire & Smoke) |
| Gap Width      | 1.5mm to 4mm         | 1.5mm to 4mm        | 6mm                   | 3mm*                          |

*\*Gaps in excess of 3mm are permissible provided a suitable smoke seal is included*

**DOOR LEAF ALIGNMENT**

The door assembly design shall be such that when closed, single acting leaves are fully flush with the face of the frame and the face of leaves in double door assemblies shall be flush with each other at meeting stiles when closed.

## 4.11 Gap Sealing

### 4.11.1 General

| GENERAL REQUIREMENTS/NOTES |  |
|----------------------------|--|
| •                          | Gap sealing products must meet <b>all</b> of the requirements detailed in Section 4.11.2 |

## 4.11.2 Gap Sealing Products – Requirements for Approval

| GENERAL REQUIREMENTS  |                                    |                             |                       |                         |
|---|------------------------------------|-----------------------------|-----------------------|-------------------------|
| Gap sealing products used in conjunction with the FD30 three-layer particleboard leaf, with or without feature grooves, must have been successfully fire tested for 30 minutes fire resistance in accordance with BS476: Part 22: 1987 or BS EN 1634-1: 2014. In addition, they must meet all of the requirements detailed below; |                                    |                             |                       |                         |
| FIRE TEST PRESSURE REGIME   |                                    |                             |                       |                         |
| Must have been successfully fire tested when sealing a gap located above the neutral pressure axis  |                                    |                             |                       |                         |
| SUPPORTING CONSTRUCTION   |                                    |                             |                       |                         |
| Must have been successfully fire tested when sealing a linear gap between the rear of a timber frame and a steel/timber stud partition, or be representative of the substrate into which it is being used.  |                                    |                             |                       |                         |
| GAP SIZE  |                                    |                             |                       |                         |
| Must have been successfully fire tested when sealing a linear gap, equal to, or larger than, that proposed.   |                                    |                             |                       |                         |
| SEALANT DEPTH   |                                    |                             |                       |                         |
| Must be applied to a depth, equal to, or greater than, that used when it was fire tested and finish flush with the outer face of the door frame.  |                                    |                             |                       |                         |
| BACKING MATERIAL  |                                    |                             |                       |                         |
| TESTED BACKING MATERIAL   | PERMITTED BACKING MATERIAL OPTIONS |                             |                       |                         |
| No backing material included  | None                               | CC Polyethylene backing rod | Expanding FR PU foam* | Mineral rock fibre      |
| Closed cell polyethylene backing rod  |                                    | CC Polyethylene backing rod | Expanding FR PU foam* | Mineral rock fibre      |
| Expanded FR PU foam   |                                    |                             | Expanding FR PU foam* | Mineral rock fibre      |
| Mineral rock fibre  |                                    |                             |                       | Mineral rock fibre only |
| * Must have been successfully fire tested when sealing a linear gap between the rear of a timber frame and a steel/timber stud partition, or be representative of the substrate into which it is being used.  |                                    |                             |                       |                         |
| ARCHITRAVES   |                                    |                             |                       |                         |
| TESTED ARCHITRAVE MATERIAL  | PERMITTED ARCHITRAVE MATERIAL      |                             |                       |                         |
| No architraves fitted   | None fitted                        | MDF                         | Softwood              | Hardwood                |
| MDF   |                                    | MDF                         |                       | Hardwood                |
| Softwood  |                                    |                             | Softwood              | Hardwood                |
| Hardwood  |                                    |                             |                       | Hardwood                |

## 4.12 Intumescent Seals

| INTUMESCENT SEAL TYPE  | APPROVED MANUFACTURER/SUPPLIER  | SIZE/POSITIONS      |
|--|---|---------------------|
| PVC encased graphite-based (e.g. Mann McGowan, Pyroplex or Astroflame) or Lorient 617 type seals     | From any member of the Intumescent Fire Seals Association (IFSA) or from a company with Third Party Certification from a body such as IFC Certification Ltd | Refer to Appendix A |
| ADDITIONAL REQUIREMENTS/NOTES  |   |                     |
| Intumescent protection is also required to specific items of building hardware – refer to Appendix B |   |                     |

## 4.13 Ambient Temperature Smoke Seals

Smoke seals that have been tested in accordance with BS EN 1634-3: 2004 (ambient temperature) or BS476: Part 31: Section 31.1: 1983 and shown not to leak by more than 3m<sup>3</sup>/m/hr at 25Pa may be used in conjunction with the proposed door assemblies to provide smoke control.

The orientation of the seals, door edge gaps, degree of hardware interruption, and leaf configuration, will need to be as tested in accordance with BS EN 1634-3: 2004 (ambient temperature) or BS476: Part 31: Section 31.1: 1983 to achieve the desired level of smoke control.

Test evidence to BS476: Part 22: 1987 shall be available to demonstrate that the smoke seals will not adversely affect the overall fire resistance of timber door assemblies, when fitted in the proposed arrangements.

## 5. Limitations

This report addresses itself solely to the ability of the proposed assemblies described to satisfy the criteria of the fire resistance test and does not imply any suitability for use with respect to other unspecified criteria.

This document only considers the door assemblies described, herein, and assumes that the surrounding construction will provide no less restraint than the tested assembly and that it will remain in place and be substantially intact for the full fire resistance period.

This report is issued on the basis of test data and information to hand at the time of issue. If contradictory evidence becomes available, KFS reserves the right to withdraw the report unconditionally but not retrospectively.

As per the guidance outlined in the Passive Fire Protection Forum (PFPF): *'Guide to Undertaking Technical Assessments of Fire Performance of Construction Products Based on Fire Test Evidence, 2021, Industry Standard Procedure'*, appropriate action has been taken to mitigate the risk of a conflict of interest arising during the preparation of this report. All individuals involved in the production, or subsequent review, of this assessment have declared any perceived conflicts of interest, with regards to the sponsor or subject(s) of this report, prior to working on this project.

The assessor and reviewer have been deemed suitable for involvement in the production of this assessment in accordance with the guidance outlined in the Passive Fire Protection Forum (PFPF): *'Guide to Undertaking Technical Assessments of Fire Performance of Construction Products Based on Fire Test Evidence, 2021, Industry Standard Procedure'*.

Where the constructional information in this report is taken from details provided to Kiwa Fire Safety Compliance (KFS) and/or from fire resistance test reports referenced herein, it is, therefore, limited to the information given in those documents. It is necessarily dependent upon the accuracy and completeness of that information. Where constructional or manufacturing details are not specified, or discussed, herein, it should not, therefore, be taken to infer approval of variation in such details from those tested or otherwise approved.

The analysis and conclusions within this report are based upon the likely fire resisting performance of a complete door assembly that is manufactured and installed in accordance with this document, and offered for fire resistance testing in 'perfect' condition. In practice, management procedures must be in place in any building where the door assemblies are installed, to ensure that no parts of the assembly are damaged or faulty. Further, the doors must open and close without the use of undue force. The edge gaps/alignment of door leaves must be in accordance with the tolerances defined, herein, when the doors are closed. Any such shortfalls in respect to the condition of the assemblies will invalidate the approval by KFS and may seriously affect the ability of the assemblies to provide the required level of fire resistance performance. Determination of what constitutes wear or damage, and any corrective actions in order to return assemblies to the required condition, should only be carried out following consultation with the manufacturer and KFS.

This report applies to fire door assemblies that are evaluated to BS476: Part 22: 1987; which is an applicable test method currently referenced within guidance to Building Regulations in the United Kingdom, and in building codes in some other countries. However, KFS have a duty of care to advise that introduction of CE Marking may become compulsory for fire resisting doorsets marketed in the EU, during the validity period of this report; in which case, users should contact KFS for further details/advice.

Where the assessed constructions have not been subject to an on-site audit by Kiwa Fire Safety Compliance, it is the responsibility of anyone using this report to confirm that all aspects of the assemblies fully comply with the descriptions and limitations, herein.

Any materials specified in this report have been selected and judged primarily on their fire performance. KFS do not claim expertise in areas other than fire safety. Whilst observing all possible care in the specification of solutions, we would draw the reader's attention to the fact that during the construction and procurement process, the materials used should be subjected to more general examination regarding the wider Health and Safety, and CoSHH Regulations. Designers, manufacturers and installers are reminded of their responsibilities under the CDM Regulations; but particularly with regard to installation and maintenance of heavy or inaccessible items.

This assessment considers the fire resistance performance of the door assemblies when tested with the leaves in the closed position, within the frame reveal; either retained by the latch, or self-closing device, or locked shut, as applicable. The door assemblies will only provide the assessed fire performance when in a similar configuration; and it is the responsibility of the building occupants/owner to ensure that this is the case.

This report is provided to the sponsor on the basis that it is a professional independent engineering opinion as to what the fire performance of the construction/system would be should it to be tested to the named standard. It is KFS's experience that such an opinion is normally acceptable in support of an application for building approvals, certainly throughout the UK and in many parts of Europe and the rest of the world.

However, unless KFS have been commissioned to liaise with the Authorities that have jurisdiction for the building in question for the purpose of obtaining the necessary approvals, KFS cannot assure that the document will satisfy the requirements of the particular building regulations for any building being constructed.

It is, therefore, the responsibility of the sponsor to establish whether this evidence is appropriate for the application for which it is being supplied and KFS cannot take responsibility for any costs incurred as a result of any rejection of the document for reasons outside of our control. Early submittal of the Report to the Authorities will minimise any risks in this respect.

## 6. Validity

This Field of Application Report has been prepared based on Kiwa Fire Safety Compliance's present knowledge of the products described, the stated testing regime and the submitted test evidence. For this reason, anyone using this document after February 2027 should confirm its ongoing validity.

This Field of Application Report is not valid unless it incorporates the declaration by the applicant given in Section 8 duly signed by the applicant.

### Passive Fire Protection Forum (PFPF) - Industry Standard Procedure 2021

'Guide to Undertaking Technical Assessments of Fire Performance of Construction Products Based on Fire Test Evidence'

- We agree to withdraw this assessment from circulation should the component or element of structure, or any of its component parts be the subject of a failed fire resistance test to the standard against which this assessment is being made.
- We understand that this assessment is based on test evidence and will be withdrawn should evidence become available that causes the conclusion to be questioned. In that case, we accept that new test evidence may be required.
- We are not aware of any information that could affect the conclusions of this assessment. If we subsequently become aware of any such information, we agree to ask the assessing authority to withdraw the assessment.

| Leaf Frame/Head                 | 1no. 20 x 4mm intumescent seal centrally fitted in either the leaf head or opposing frame reveal |                      |
| Vertical Leaf Edges/Frame jambs | 1no. 20 x 4mm intumescent seal centrally fitted in either the leaf edge or opposing frame reveal |                      |
| Meeting edges                   | 1no. 20 x 4mm intumescent seal centrally fitted in the closing edge of the active leaf only      |                      |

**Note:** For approved intumescent seal types, refer to Section 4.12

## Appendix B Installation of Hardware

### B.1 Single Axis Hinges

| ELEMENT                       |     | SPECIFICATION/QUANTITY/DIMENSIONS   |   |
|-------------------------------|-----|---|---|
| Hinge Types                   |     | Fixed pin, washered butt, ball bearing butt, lift-off type or journal supported   |   |
| Blade Height                  |     | 89 - 110mm  |   |
| Blade Width                   |     | 30 - 35mm   |   |
| Blade Thickness               |     | 2.5 - 3.5mm   |   |
| Material                      |     | Brass, Phosphor Bronze, Steel or Stainless Steel  |   |
| Fixings                       |     | Minimum 30mm long x 4mm diameter steel screws   |   |
| Minimum Number                |     | Leaves up to 2200mm high  | 3no. hinges   |
|                               |     | Leaves over 2200mm high   | 4no. hinges   |
| Positions                     | 3no | Top   | 125 - 175mm down from the leaf head to the top of the hinge   |
|                               |     | Middle  | Either equi-spaced between the top and bottom hinges or positioned 150 – 250mm below the top hinge  |
|                               |     | Bottom  | 175 - 250mm up from the bottom of the leaf to the bottom of the hinge blade   |
|                               | 4no | Top   | 125 - 175mm down from the leaf head to the top of the hinge   |
|                               |     | Second and Third  | Either equi-spaced between the top and bottom hinges or second hinge positioned 150 – 250mm below the top hinge and the third hinge equi-spaced between the second and bottom hinge |
|                               |     | Bottom  | 175 - 250mm up from the bottom of the leaf to the bottom of the hinge blade   |
| Intumescent Protection        |     | Non required  |   |
| Additional Requirements/Notes |     | <ul style="list-style-type: none"> <li>• Rising butts, cranked butts and spring hinges are not approved under the scope of this Assessment</li> <li>• Single axis hinges must have been successfully type tested for conformity to all the requirements of BS EN 1935: 2002 including the additional requirements for fire/smoke door use</li> <li>• Single axis hinges must have a Door Mass Grade, as defined in BS EN 1935: 2002, which demonstrates the hinge is capable of supporting a door leaf weight, equal to, or greater than, that proposed.</li> </ul> |   |

## B.2 Mortice Locks/Latches

| ELEMENT                         | SPECIFICATION/QUANTITY/DIMENSIONS   |  |
|---------------------------------|---|--|
| Latch/Lock Type                 | Mortice latches, tubular mortice latches, sashlocks and deadlocks   |  |
| Maximum Forend Dimensions       | 235mm high x 22mm wide<br>or<br>60mm high x 25mm wide   |  |
| Maximum Strike Plate Dimensions | 235mm high x 24mm wide (excluding tongue)<br>or<br>60mm high x 25mm wide (plus 31mm high x 15mm wide tongue)  |  |
| Maximum Body Dimensions         | 165mm high x 80mm wide x 15mm thick   |  |
| Material                        | Steel based with no essential part of the lock/latch to comprise polymeric or other low melting point (<800°C) materials and should not contain any flammable materials   |  |
| Position                        | Centred at 1000mm (± 200mm) above the bottom of the door leaf   |  |
| Intumescent Protection          | Forend/strike plate up to 152mm long  | None required  |
|                                 | Forend/strike plate greater than 152mm long   | 2mm thick Interdens or Therm-A-Strip intumescent sheet fitted under the lock forend and strike plate |
| Additional Requirements/Notes   | <ul style="list-style-type: none"> <li>• It is a condition of this assessment that there must be at least 50mm width of stile, or 'rail' between two apertures, between the lock/latch mortice and the glazed aperture.</li> <li>• Over-morticing is to be avoided; mortices shall be as tight as possible to the latch.</li> <li>• If there are gaps around the case (not exceeding 2mm) then these must be made good with intumescent mastic or sheet material.</li> <li>• Holes for spindles or cylinders shall be kept as small as is compatible with the operation of the hardware</li> <li>• Morticed locks/latches must have been successfully type tested for conformity to all the requirements of BS EN 12209: 2016 including the additional requirements for fire/smoke door use</li> <li>• Mortice lock/latches must have achieved the appropriate Grade in respect of suitability of use in fire resisting doors, as defined in BS EN 12209: 2016. This constitutes Grade B for latched door configurations and Grade N for unlatched door configurations</li> </ul> |  |

## B.3 Door Closers

### GENERAL REQUIREMENTS/NOTES

Every hinged fire door (both leaves in double doors), including flat entrance doors and doors between a dwelling and an integral garage, must be fitted with a self-closing device, with the exception of the following;

- Fire doors which are normally kept locked shut and labelled with an appropriate sign which complies with BS5499: Part 1: 1990
- Fire doors to cupboards
- Fire doors within flats or dwellings

KFS recommends that the fire strategy for the proposed project is reviewed, as this may detail specific requirements for door closing devices, which takes precedence over the details outlined above.

This report evaluates the fire resistance performance of the doors assemblies when tested with the leaves in the closed position, within the frame reveal; either retained by the latch, or door closing device, or locked shut, as applicable. If no door closing device is fitted, good management practice must be in place to ensure the doors are fully closed into the frame reveal when not in use.

All door closing devices must be fitted according to the manufacturer's instructions (unless stipulated otherwise herein) and be adjusted so that they are capable of fully closing the door leaf, against any friction imposed by the latch (and smoke seals, if fitted), from any position of opening.

### B.3.1 Surface Mounted Door Closers

#### GENERAL REQUIREMENTS/NOTES

Surface mounted door closers must have been fire tested or assessed by KFS for use on FD30 timber door leaves hung within timber frames

## B.4 Flush Bolts

| ELEMENT                | SPECIFICATION/QUANTITY/DIMENSIONS   |
|------------------------|---|
| Maximum Size           | 152mm long x 19mm wide x 19-37mm deep   |
| Material               | Steel based with no essential part of the flush bolt to comprise polymeric or other low melting point (<800°C) materials and should not contain any flammable materials               |
| Position               | <ul style="list-style-type: none"> <li>• Positioned at the top and bottom of the vertical meeting edge</li> <li>• Must be located on the centre line of the leaf thickness</li> </ul> |
| Intumescent Protection | None required   |

## B.5 Push/Kick Plates

| ELEMENT                       | SPECIFICATION/QUANTITY/DIMENSIONS  |
|-------------------------------|--|
| Maximum Dimensions            | Maximum 0.2m <sup>2</sup> per leaf face in any orientation   |
| Fixing                        | <ul style="list-style-type: none"> <li>• Mechanically fixed with short screws</li> <li>• Glued with a thermally softening adhesive (e.g. contact adhesive)</li> </ul>  |
| Material                      | Steel or aluminium   |
| Intumescent Protection        | None required  |
| Additional Requirements/Notes | <ul style="list-style-type: none"> <li>• Must be cut short of door stops but may be located under the handle rose/escutcheons</li> <li>• Push/kick plates must be surface fixed only. These items must not be recessed into the leaf face</li> </ul> |

## B.6 Surface Mounted Pull Handles

| ELEMENT                       | SPECIFICATION/QUANTITY/DIMENSIONS   |
|-------------------------------|---|
| Max Dimensions                | Fixing points must be no greater than 800mm apart   |
| Material                      | Steel or aluminium  |
| Intumescent Protection        | Bolt-through fixings must be wrapped in 1mm thick Interdens/Therm-A-Strip or graphite based intumescent sheet material              |
| Additional Requirements/Notes | Pull handles that are fixed through the leaf shall use clearance holes as close fitting as possible to the intumescent wrapped bolt |

## B.7 Door Selectors

| ELEMENT                       | SPECIFICATION/QUANTITY/DIMENSIONS   |
|-------------------------------|---|
| Max Dimensions                | No restrictions   |
| Material                      | Steel or aluminium  |
| Position                      | Surface mounted to the door leaf or frame   |
| Intumescent Protection        | None required   |
| Additional Requirements/Notes | The installation of the door selector must not involve the removal of any material from the door leaf or door frame |

## B.8 Dropseals

| ELEMENT                | SPECIFICATION/QUANTITY/DIMENSIONS   |
|------------------------|---|
| Position               | Bottom leaf edge - Fitted centrally in the leaf thickness.  |
| Maximum Dimensions     | 35mm high x 14mm thick x full width of leaf   |
| Intumescent Protection | Mortise lined with 1mm thick Interdens/Therm-A-Strip or graphite based intumescent sheet material |

## Appendix C Summary of Fire Test Evidence

| TEST REPORT    | TEST SPONSOR   | TEST LAB                | TEST DATE  | CONFIGURATION       | LEAF SIZE                      | TEST STANDARD        | RESULT                                   | ITEMS/DETAILS SUPPORTED BY TEST EVIDENCE  |
